

Townsend Bearings

**Rosta
Rubber Suspension Units**

Product Range "Modules"

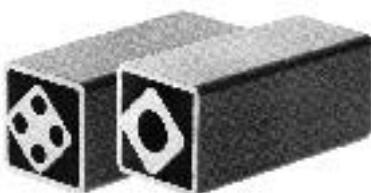

ROSTA Rubber Suspension Unit

Type DR-S

Page 19

Housing made out of steel, inner square section made out of steel tube for mounting "plug-in" lever arms on one or both sides. The inserted part should be at least three times longer than the clearance "C". Up to type DR-S 18 the lever arms can be mounted by one through-bolt and the levers are then fixed by frictional force at any position within 360°. Both ways of fixation are particularly well suited for motions at the plus **or** minus angular range (no alternating motions across the neutral axis = play). All metal parts are paint-finished.

ROSTA Rubber Suspension Unit

Type DR-A/C

Pages 20/21

Steel housing with inner square section made of light alloy with four small bores or one big through bore. Levers can be mounted on one or on both sides by means of bolts. Type **DR-A** with two or four through bores, especially constructed for transmitting alternating motions by passing the neutral axis in either direction. Type **DR-C** with central bore. The frictional force of this type assures a safe fixation of the lever arms in any position. All metal parts are paint-finished.

ROSTA Rubber Suspension Unit

Type DK-S

Page 22

Round housing made of light alloy profile, inner square section made out of steel tube, the "plug-in" lever arms can be mounted on one or both sides. The inserted part should be at least three times longer than the clearance "C". This kind of connection is particularly well suited for angular motions at the plus **or** minus range (no alternating motions across the neutral axis = play). All metal parts are paint-finished.

ROSTA Rubber Suspension Unit

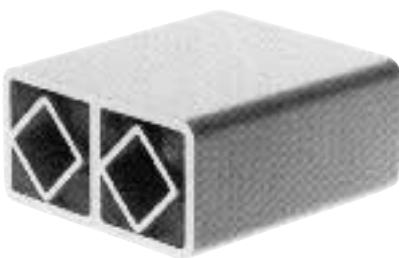

Type DK-A

Page 23

Round housing and inner square section made of light alloy profiles, inner square section with four "through-bores", the lever arms can be bolted on and, if necessary, the bores can be tapped, too. Both ways provide an excellent connection without play which is necessary in order to transmit alternating motions by passing the neutral position in either direction. All metal parts are paint-finished.

Product Range

ROSTA Rubber Suspension Unit

Type DO-S

Page 24

Housing up to size 45 made out of light alloy profile, size 50 made out of spheroidal graphite cast iron, inner square section made out of steel, the "plug-in" lever arms are to be attached on one or both sides. Please note, the inserted length should be at least three times longer than the clearance "C". Up to size DO-S 18 the lever arms can also be mounted by one "through-bolt", the levers are held by the resulting frictional force. Thereby, the positioning of the levers at any position within 360° is admissible. Both ways are particularly well suited for alternating motions at the plus **or** minus angular range. All metal parts are paint-finished.

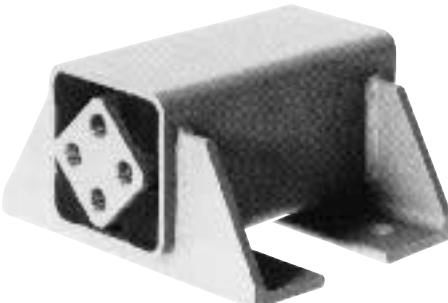

ROSTA Rubber Suspension Unit

Type DO-A

Page 25

Housing up to size 45 made out of light alloy profile, size 50 made out of spheroidal graphite cast iron, inner square section made out of light alloy profile with four "through-bores". The levers can be mounted on one or both sides by means of bolts. It provides an excellent attachment without play which is most important in order to transmit alternating motions by passing the neutral axis in either direction. All metal parts are paint-finished.

ROSTA Rubber Suspension Unit

Type DW-A

Page 26

Housing with welded-on brackets and inner square section made out of steel, inner square section with four threaded holes on both sides, suitable for mounting lever arms and attachments clearance-free. The unit has to be bolted on machine part through the welded-on brackets. These units are designed to transmit alternating motions which occur in either direction, by passing the neutral position. All metal parts are paint-finished.

Product Range

ROSTA modules should be connected on machine parts/structures by means of the standardized clamps and brackets. Relevant welded connections would affect (overheat) the rubber inserts and damage the entire suspension device!

ROSTA Clamp Type BR (fitting all DR-elements)

Page 27

The clamps are supplied separately without bolts. They are standardized to fit exactly for the fixation and positioning of the ROSTA rubber suspension units type DR-S, DR-A and DR-C without any welding. For longer units two or more clamps are recommended. The clamps are paint-finished.

ROSTA Clamp Type BK (fitting all DK-elements)

Page 27

The clamps are supplied separately without bolts. They are standardized to fit exactly for the fixation and positioning of the ROSTA rubber suspension units type DK-S and DK-A by frictional force created by the bolted double clamp. For longer units two or more clamps are recommended. All clamps are paint-finished.

ROSTA Bracket Type WS

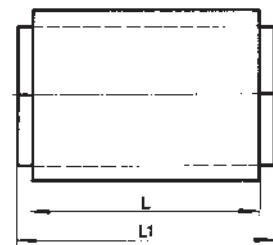

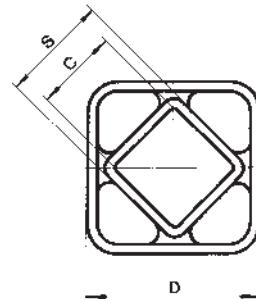

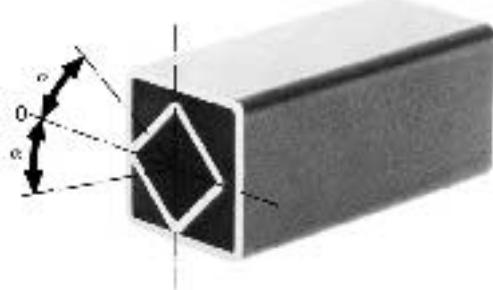

Page 27

This multi-purpose brackets make an easy screw connection possible on the inner squares of the ROSTA rubber suspension units type DR-A, DK-A and DO-A (as well as a housing fixation of the tensioner devices type SE). The base of the angle section can be positioned in both directions and offers together with the different clamps many combination possibilities of the element assembling. The brackets are paint-finished.

"inserted
lever core"

"outer square
plug-in connection"

Plug-in Connections

An easy and cost-effective connecting variant, if the unit is under pretension and acts in **only one direction**. Alternating oscillations in both directions would cause noise due to play compensation.

* "inserted lever core":

The connection square has to be of polished quality with tolerance from h9 to l11. According to the specific connection, edge radius the squares might have to be machined.

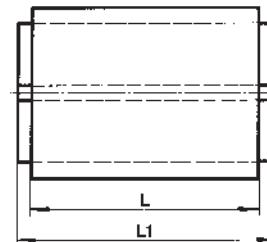

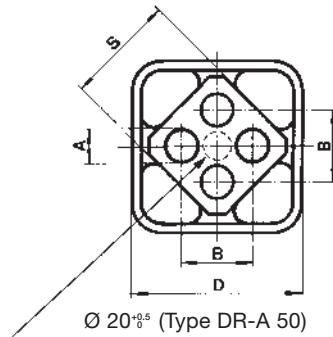

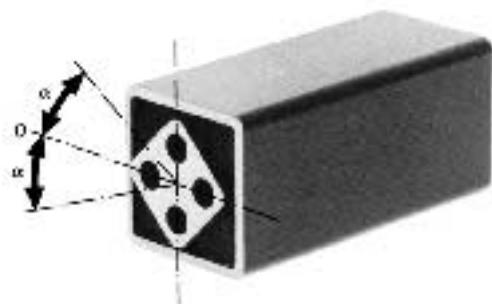

** "outer square plug-in connection":

The tolerance of the outer housing corresponds to commercial square tubes. The thickness of the additional protection paint of 40 to 80 µm has to be taken in consideration.

Bolted Lever Arm on Inner Square

Connection by means of 2 or 4 shaft screws across the inner square profile; or by means of set screws directly on the square profile (the customer-side thread taping is required).

Bolted Lever Arm on Inner Square

Positioning of the lever arm by means of central shaft screw and resulting frictional connection. Ideal for continuous positioning of the lever arm.

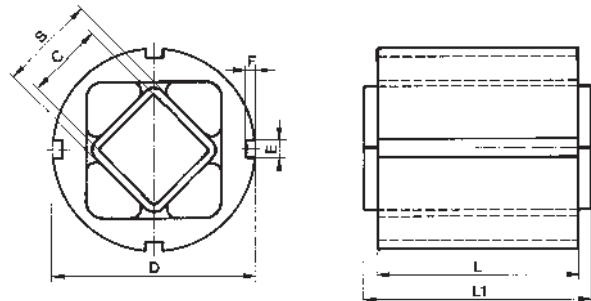

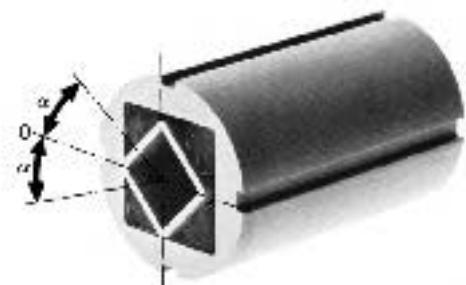

This connection should not be applied at alternating oscillations by big angular motions ($> \pm 10^\circ$).

In order to get the most best frictional connection, the paint cover on the core front should be removed prior bolting any connection part.

* Plug-in connection "inserted" see page 19.

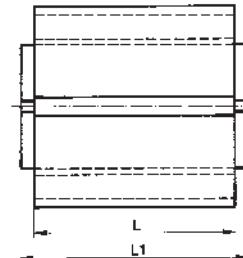

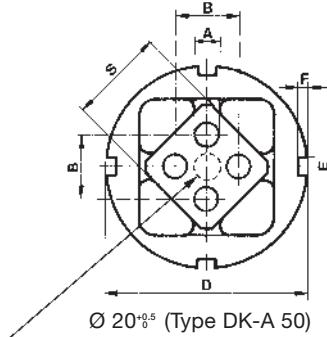

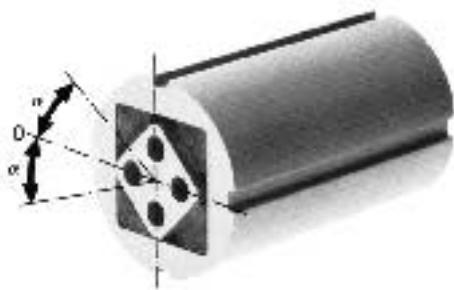

** Frictional "Fist" Connection on Outer Housing

The round outer housing can be either positioned by means of a clamping jaw or inserted into a "fist"-bracket. The tolerances of the outer housing diameter as well as the thickness of the protection paint (40 to 80 µm) have to be taken in consideration.

Fixation by Clamp Type BK

The fixation of the outer housing by means of the standardized clamp type BK makes the continuous and individual pretension of the unit in both directions easy and adjustable (clamp type BK on page 27).

Bore A is designed for the fixation of the ROSTA tensioner devices type SE. Bores B are designed for the fixation of the ROSTA rubber suspension units type DR-A, DK-A, DO-A.

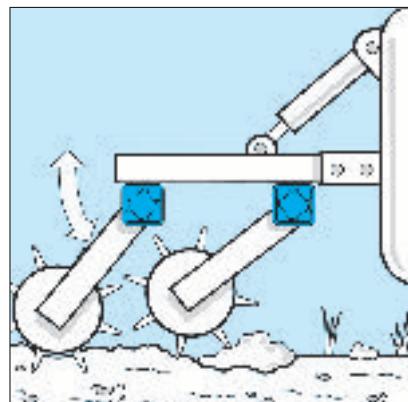

Installations

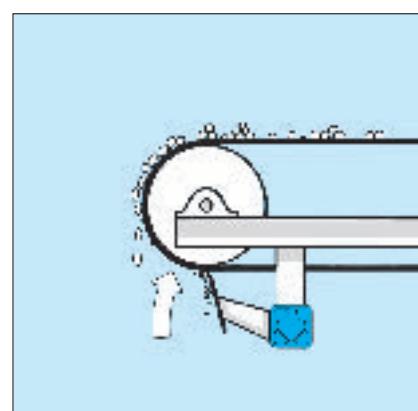

Lever bearing in concrete mixer

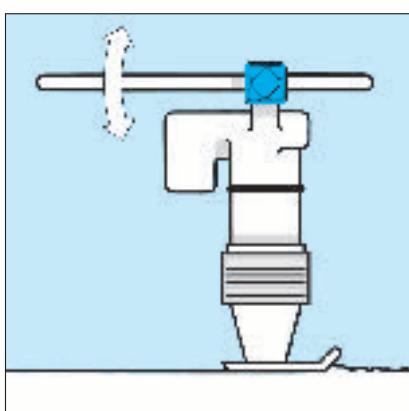

Pressure rollers in saw device

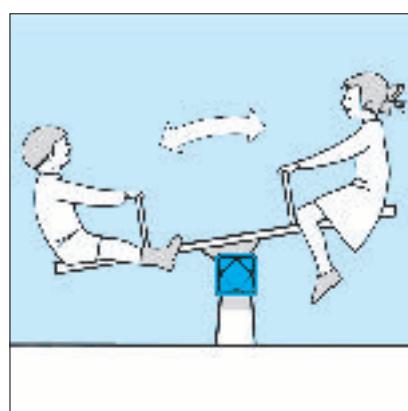

Pendulum on harrow rollers

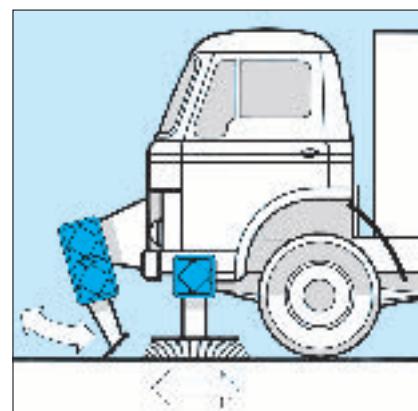

Conveyor-belt scraper

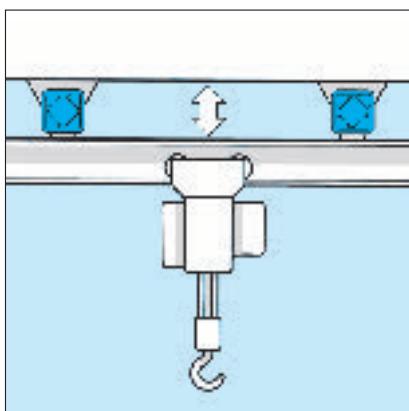

Handle-bar insulation

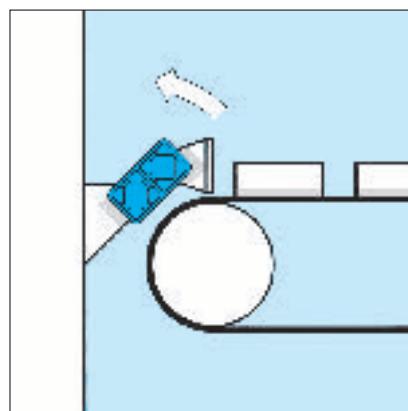

See-saw support

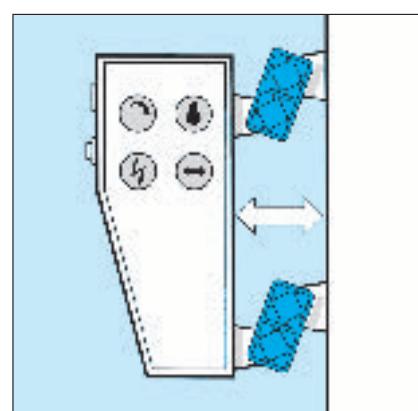

Elastical brush and scraper suspension

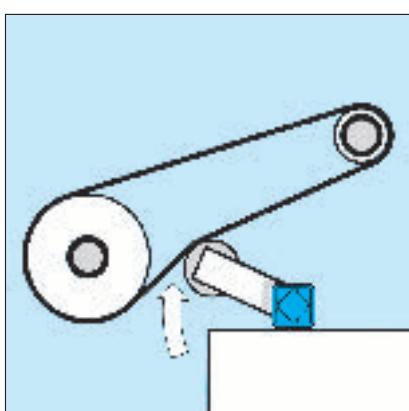

Suspended crane rail

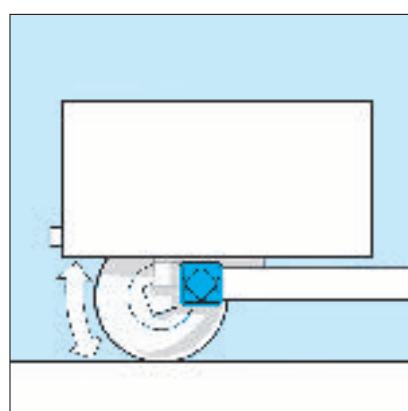

Shock absorber

Control unit insulation

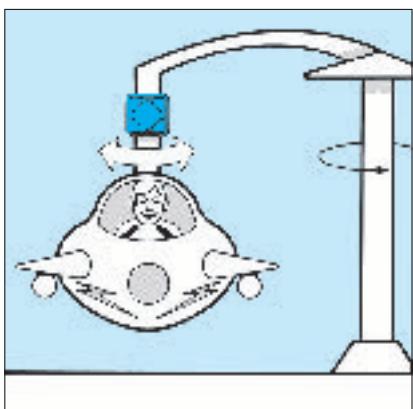

Chain and belt tensioner

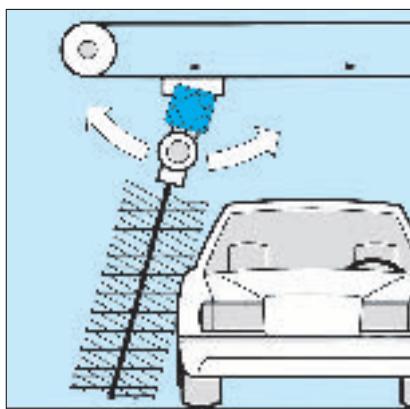

Independent wheel suspension

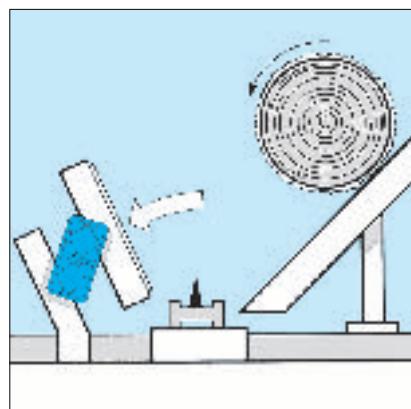

Installations

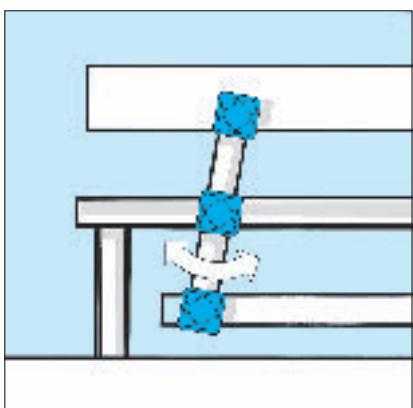

Pendulum on amusement ride

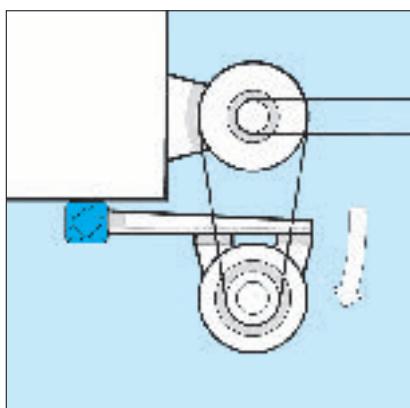

Compensation bearing for car brush

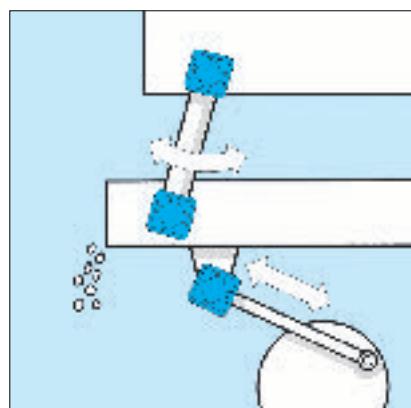

Impact suspension in feeder

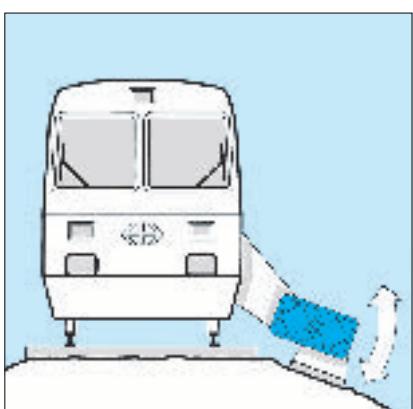

Double suspension

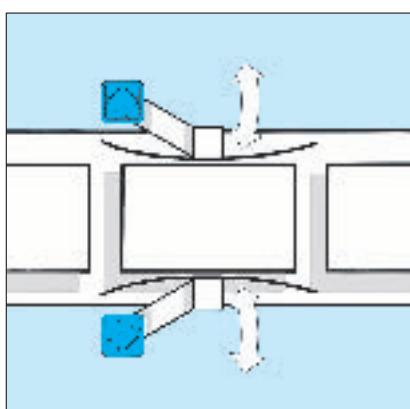

Motor base

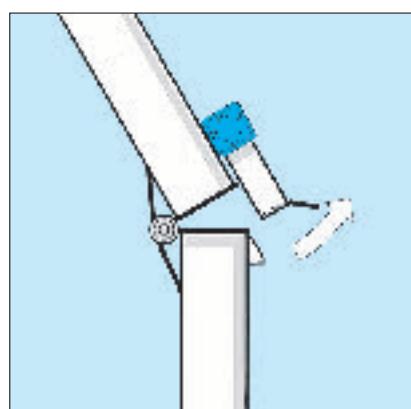

Shaker conveyor

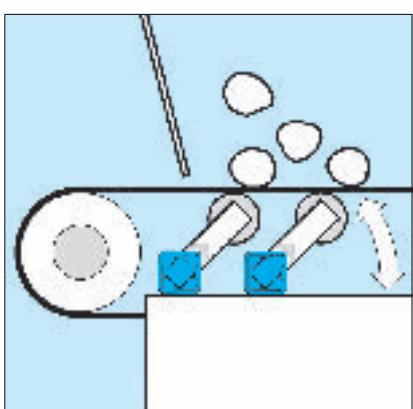

Compactor-suspension

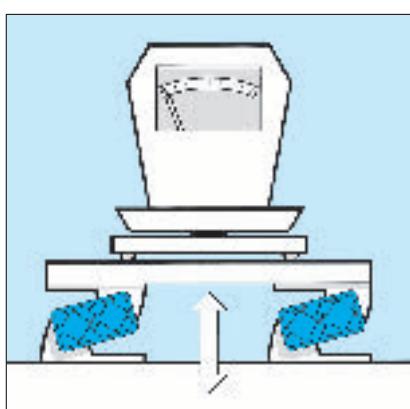

Guide rail

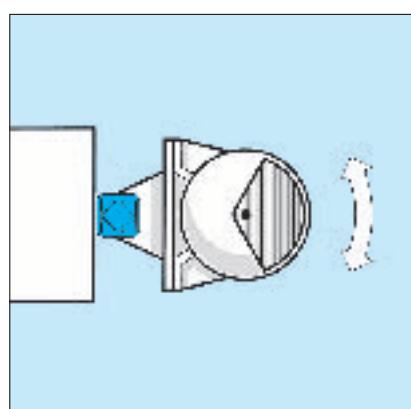

Suspended pawl

Impact-idler suspension

Passive insulation

Suspended unbalanced motor

Fixation and Connecting Recommendations

Fixations to Housing

Fig. 1 Square tubular housing with clamp BR

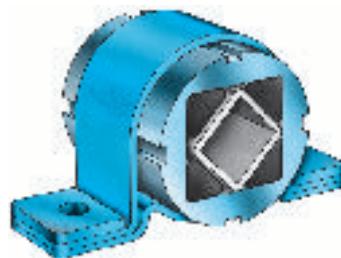

Fig. 2 Round housing with clamp BK

Fig. 3 Outer housing in clamping jaw

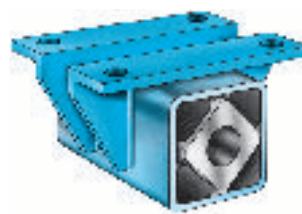

Fig. 4 Double bracket welded on housing

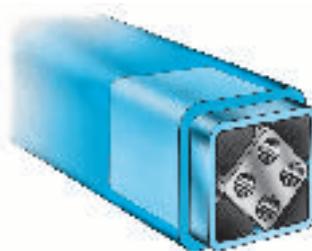

Fig. 5 Plug-in connection (also see page 19)

Fig. 6 Dual-thread welded on housing

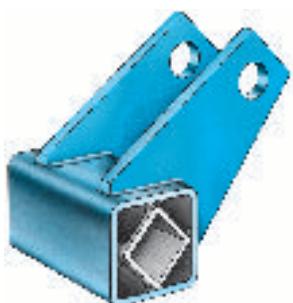

Fig. 7 Dual-levers welded on housing

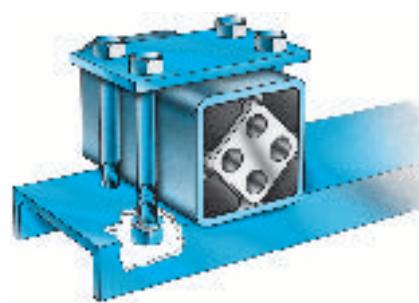

Fig. 8 Bridge-clamp over housing

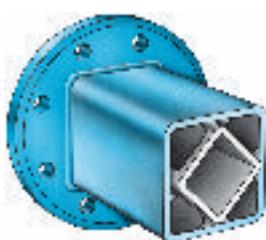

Fig. 9 Flange welded on housing

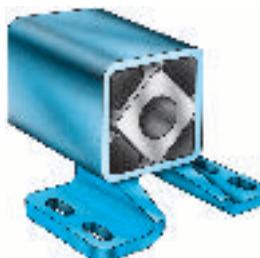

Fig. 10 Housing in cast iron

Fixation and Connecting Recommendations

Fixations to Inner Square Section

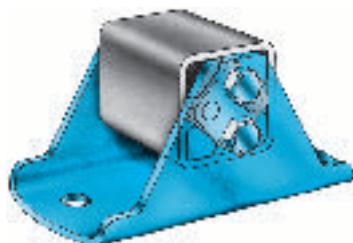

Fig. 11 Inner square section with four through bores and bracket UV

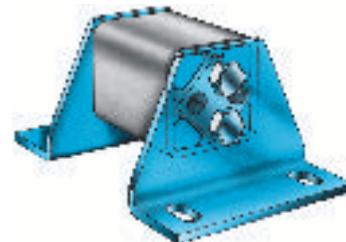

Fig. 12 Inner square section with four through bores and brackets WS

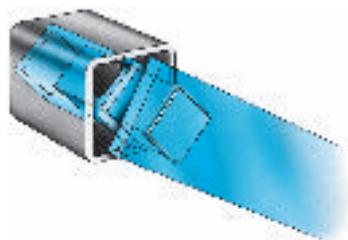

Fig. 13 Plug-in connection with lever and welded-on square steel piece

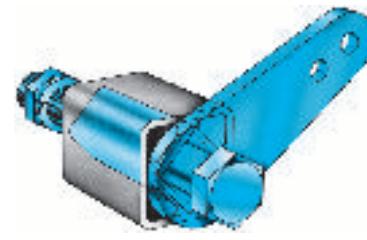

Fig. 14 Lever connection with one through bolt

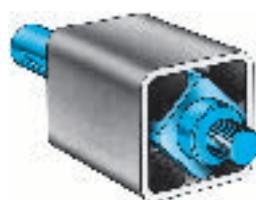

Fig. 15 Inner square section made of solid metal and machined threads on both sides

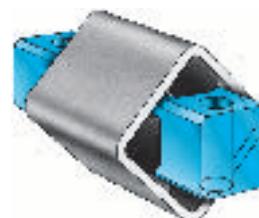

Fig. 16 Inner square section made of solid metal and cross bores on both protruding sides

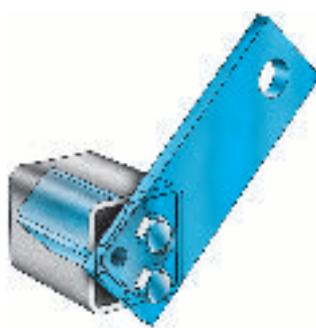

Fig. 17 Inner square section with four through bores and bolted-on lever (see page 20)

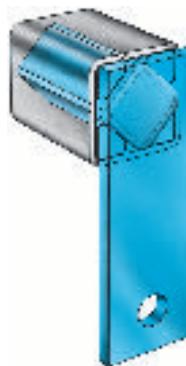

Fig. 18 Inner square section made of solid steel and welded-on bracket

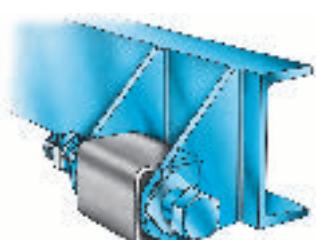

Fig. 19 Inner square section with a central through bore (see page 21)

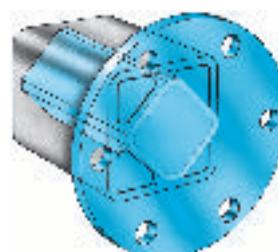

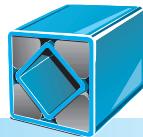

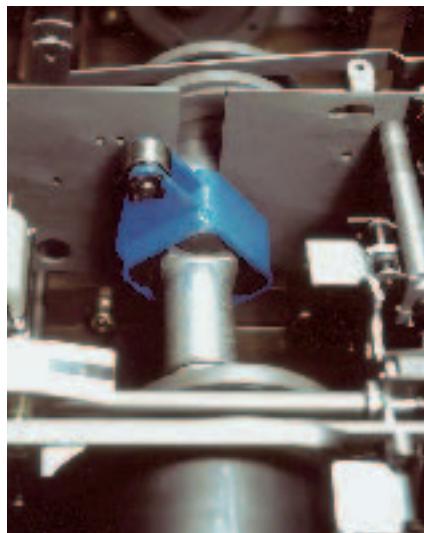

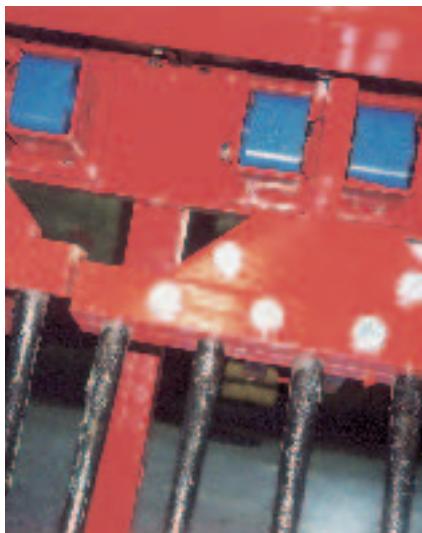

Fig. 20 Inner square section made of solid steel and welded-on flange

Applications

Elastic stop to absorb high impacts

Elastic suspension of a rake
in potato harvester

Suspension of a brush in road sweeper

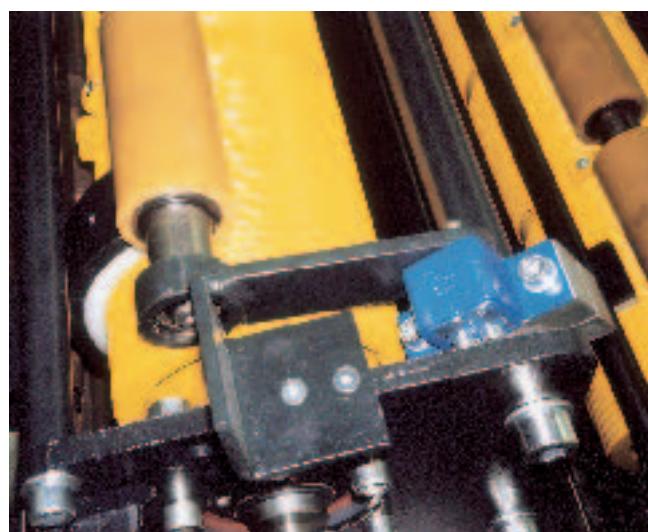

Elastic suspension of caliper roll in elevator

"Floating" suspension of weighing device in belt conveyor

Elastic suspension of shaping knife in baler

Elastic caliper roll suspension in cardboard rolling machine
